

Deep Learning and Image Analysis

Dr. Deeksha ARYA

Project Assistant Professor
Center for Spatial Information Science (CSIS)

May 28, 2026

Exercise Content:

- ✂ Basic training concept of deep learning for image processing
- ✂ Convolutional Neural Networks(CNN)
- ✂ Google Colab tutorial for image processing(road crack classification)

What is Machine Learning?

- Computer algorithms that can improve automatically through experience and the use of data [Tom Mitchell, 1997]
- The way to achieve Artificial Intelligence (AI)

Machine learning	Main Feature
Supervised Learning	Labeled data
Unsupervised Learning	Unlabeled data
Reinforcement Learning	Guided by rewards / punishment

Deep learning

- A branch of Machine Learning
- Use Deep Neural Networks(DNN) that resemble the structures of human brains
- Widely used for image processing

Training steps for machine learning processing :

- 1.Import the Data
- 2.Clean the Data
- 3.Split the Data into Training/ Test Sets
- 4.Create a Model
- 5.Train the Model
- 6.Make predictions
- 7.Evaluate and Improve

Training steps for machine learning processing :

1.Import the Data

2.Clean the Data

3.Split the Data into Training/ Test Sets

4.Create a Model

5.Train the Model

6.Make predictions

7.Evaluate and Improve

Libraries:

1.Numpy

2. Pandas

3.Matplotlib/cv2

Basic concept of the image:

157	153	174	168	150	152	129	151	172	161	155	156
155	182	163	74	75	62	33	17	110	210	180	154

194	68	137	251	237	239	228	227	87	71	201	
172	105	207	233	233	214	220	239	228	98	74	206
188	88	179	209	185	215	211	158	139	75	20	169
189	97	165	84	10	168	134	11	31	62	22	148
199	168	191	193	158	227	178	143	182	106	36	190
205	174	155	252	236	231	149	178	228	43	95	234
190	216	116	149	236	187	86	150	79	38	218	241
190	224	147	108	227	210	127	102	36	101	255	224
190	214	173	66	103	143	96	50	2	109	249	215
187	196	235	75	1	81	47	0	6	217	255	211
183	202	237	145	0	0	12	108	200	138	243	236
195	206	123	207	177	121	123	200	175	13	96	218

The images are all numbers(matrix).

For grayscale image is 1 channel, color image (RGB) are 3 channels.

Format: The image can be saved as png/jpeg/gif.

Resolution: refers to the number of pixel in the image or it can be regarded as size of the image.

Pixel value: for 8-bit image, the pixel range is 0-255, 16-bit is $0-(2^{16}-1)$

Convolutional Neural Networks(CNN):

※ CNN has several applications including image recognition.

Convolutional layer, pooling layer, ReLu layer(activation function), fully-connected layer

Pooling:

Max pooling Average pooling

Reduce the volume spatially, speed up the training

Model training:

Sample: 5,000 images

Batch_size= 10

Iteration= 500

Epoch=1=500 iterations

Learning_rate: the speed of learning

The essence of training model is to get the function!

$$x \gg \gg \boxed{f(x)} \gg \gg y$$

input model output

$$f(x) = w_1 * x_1 + w_2 * x_2 + \dots + w_d * x_d + b$$

We want to get the most optimized model to generates accurate predictions for not-yet-seen data!

How to evaluate your model:

		Predicted class	
		<i>P</i>	<i>N</i>
Actual Class	<i>P</i>	True Positives (TP)	False Negatives (FN)
	<i>N</i>	False Positives (FP)	True Negatives (TN)

$$precision = \frac{TP}{TP + FP}$$

$$recall = \frac{TP}{TP + FN}$$

$$F1 = \frac{2 \times precision \times recall}{precision + recall}$$

$$accuracy = \frac{TP + TN}{TP + FN + TN + FP}$$

$$specificity = \frac{TN}{TN + FP}$$

How many selected items are relevant?

Precision = $\frac{1}{2}$

How many relevant items are selected?

Recall = $\frac{1}{2}$

TP: the image with crack was predicted as positive

TN: the image without damage was predicted correctly

FP: the image without crack was regarded as cracked image

FN: the image with crack was predicted as no cracked

AI-driven Global Road Damage Detection

Started at UTokyo, this multinational project has scaled globally through Open-Access Data and Big Data Cup challenges, driving AI-powered infrastructure monitoring.
